

ABSTRACT**APPARATUS, SYSTEM AND METHOD FOR ENHANCING DATA SECURITY**

5 A data processing system, comprises a first processing resource which is
coupled to a communications network. A second processing resource is coupled to the
first processing resource. The first and second processing resources are
complementarily configured to establish a communications relationship between them
for restricting the second processing resource to executing instructions which only
10 perform allowable operations. The data processing system inhibits compromise of the
second processing resource.
